

ABSTRACT OF THE DISCLOSURE:

A method, an electronic device and a computer program, for document link presentation and selection in an electronic device. In the method a first hypertext  
5 page comprising at least one separate link area is opened in an electronic device. At least part of said first hypertext page is displayed in a view window movable in the area of said first hypertext page. A link area nearest to a first point on said view window is determined. A link  
10 list comprising links associated with said link area is formed. As a user selects a first link in the link list and a second hypertext page indicated by the first link is opened in the electronic device.
